

What the repository is made of

parsed from the source: 26 modules, 157 functions, 19 import edges, 0 classes

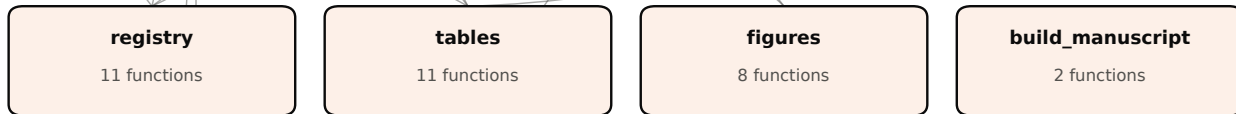

the data becomes windows

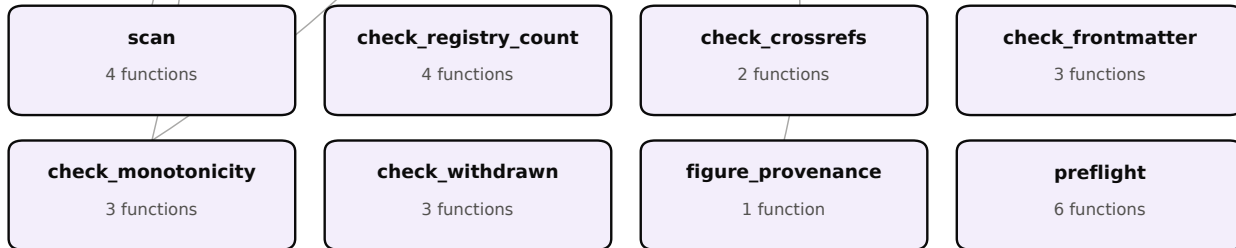

the folds become numbers

the numbers become the paper

and nothing is trusted unchecked

No classes, on purpose: every stage is a transformation that takes data and returns data, and there is no long-lived state for an object to own. The single piece of module-level mutable state is the registry cache inside figures.py — the one place where a small class would remove something rather than add ceremony.
