

— Signal to windows

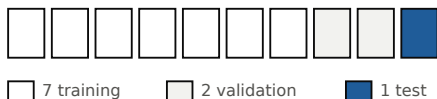

— Three constructions of the same ten recordings

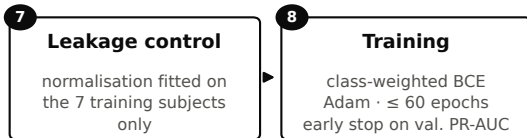

— Cross-validation and total evaluation

6 10 subjects, split once per fold

the test subject is held out entirely; every subject is held out exactly once

10 subjects × 5 seeds × 5 architectures × 3 constructions =

750

evaluated folds

Measured on every fold: ROC-AUC · PR-AUC · recall · F1 · balanced accuracy · precision
Derived afterwards, pooled or from the probability files: accuracy · Brier score · expected calibration error
